

My Own Analytical Review: The George Floyd Situation And The Police; A Review

By Kevin A. Sensenig

Draft 1.01

2020 August 19

The article by Spectator is helpful. As is various video taken on scene.

The specifics of the transcripts of the officers and Floyd speaking, as written up in Spectator, is tremendously valuable.

Given that Floyd was high:

1. He communicated I don't know many times that he was in a physical predicament and needed relief, or faced dilemma. He communicated this in English, American English, and it was clear. He repeated this. He even sensed and communicated that given the strategy of the cop(s) he was going to die.
2. If I were the cops, I would have, given Floyd's communicated predicament, have set him in a seated position on the pavement, one cop on either side just in case, and the third cop would have said, "I'm going to get you some iced tea and water. Hold tight, breath, and try to survive."
3. Whether he's high or not, he was I don't think violent or a threat – at all.
4. Whether he's high or not, he may or may not have survived if he had been treated as in (2).
5. He did not survive.
6. He may have been and seems to have been placed in a position of heightened physical stress when he actually needed space to breath and possibly recover or not. He was pinned by the third cop, repeatedly said clearly that he could not breath, and indicated his own sense of doom. He communicated this, clearly and repeatedly, according to the transcript in Spectator.
9. He may not have survived in any case.
10. One indicator might be: what was his perceptual and physical state while he was still in the car with his friends? Was he comfortable at that point and before?
11. The third cop apparently followed a rulebook guideline available to him, from cop standard rulebook.
12. I'm not sure why he applied this rule at that time, even if it was available.

13. Resisting or communicating is not necessarily violent or a threat.

14. If I were the third cop, and had Floyd under a knee pin, if Floyd was actually a threat or violent, then I would have released the knee every minute or so for 15 seconds: to let Floyd breath, and to let Floyd demonstrate cooperation, such that no further knee pin was necessary at all.

15. That way Floyd would have had a better chance of surviving. And it would have been realistic policing. The results then would have spoken for themselves. Floyd may or may not have survived. But the chances, given the opportunity to breath well, and to have access to water or iced tea, and air, and space, would have improved the odds.

16. If there was no if-then rule in the rulebook, then is the cop A, B, C to be faulted, or how much, or in any penalized or criticized for false judgment; and should the rulebook be updated to reflect this obscure field called 1) projection of a thing, electron, sphere, person, or field; 2) logic, realism, and awareness; 3) an actual situation. Cop A, B, C should be safe. Floyd should be non-violent, and may have been, if he wanted to cooperate; and Floyd should have been given options above to better have a chance to survive, perhaps, and may have cooperated to the best of his at-the-time-in-fact ability and sense-awareness to clearly communicate.

A corollary argument, with respect to society.

1. Caffeine is a drug.

2. All caffeine addicts deserve any treatment simply because they are on caffeine.

3. Caffeine may be taken by coffee or green tea or black tea.

4. It is best to first ascertain whether a person is on caffeine or not, and if so, to treat punitively if one can. One should for instance pin all and any caffeine addict if possible. This should be established as cop, citizen, interpersonal, and federal policy. This leads to a proper rules-based society, and the most profound ethic possible and known to man. This is the deeper read to “First Step Act” and the concept first step. (I’m more a NeXTstep type, but that’s ok, you’re ok – just so all NSObjects are trapped and pinned if possible, if `[[o delegate] isCaffeineObject] == TRUE`. Regardless of `[[[o delegate] caffeineObject] displayNeXTdimension]` yields a holographic image on the wall. Especially if `[o name] == @"Daniel"` and it just can’t happen anyway.

5. One should in addition a-priori commit all caffeine addicts to treatment in a psych unit; and render it a permanent biogenetic malfunction. Meds should be given for a lifetime, and the person rendered then in such as state as to be disabled, put on SSDI, and lost revenue and expenditure to the federal government, 10.4 trillion usd over 30 years.

6. This is only prudent, and will lead to the best course of action.

Sincerely,

Kevin

P.S. 10.4 trillion usd for 1990-2020 would have funded at least a subset digital circuit of the NeXTcube, NeXTstation, and NeXTstep for say many individuals, to look at, study, use, and communicate, in dimension text and living color – philosophy, logic, imagery, and text – for 30 years. At least part of the circuits, say the DSP, the CPU, the magnesium alloy box. The ethernet, the DisplayPostscript, the mouse, the Graphical User Interface, the NeXTmail, one’s own login panel and user space, and in 1994 the Web with the app Spiderwoman. In grayscale and In Living Color.

Dunno. See what you think.

Nowadays there’s Windows 10, macOS, Linux, and Enterprise digital computing. And several options to choose from, including languages and Surface and iPad. And many books, many music, and many art. From local bookstores and online digital bookstores.

None of which can be apperceived, used, or dimensioned by the caffiene addict.

Thus, it is the wisest path, the actual historical, to have expended 10.4 trillion usd over 30 years.

QED. I think. Quantum Electro-Dynamics, is what I have on record. I do not know Latin. I personally think as the Romans do, to study Latin, and to note on my visual workbench desk that Sanskrit was a historical language. And not much else can be ascertained by any caffeine addict.

Especially the unity of the spatial-temporal, and its actual manifest-as-this-very-world-unfolding: Dogen, The Diamond Sutra, and Mumon (Mumonkan Case 29: Mind moves). Dunno.

The dipolar caffeine addict. A new category.

This brings to mind Wittgenstein “Tractatus Logico Philosophicus” (Routledge) and Aristotle “Categories”. Perhaps also. <http://mvo-p.com/>, [Mvo-p And The Dimensional Psych \(And Otherwise\) Domain](#), [Zen T W Fp Logic](#). And one’s own world, this very world, and so forth.
